PREFACE

As mandated by Section 102(a) of P.L. 100-294, the Child Abuse Prevention, Adoption, and Family Services Act of 1988, the Congress directed the National Center on Child Abuse and Neglect (NCCAN) to conduct a study and report on the incidence of child abuse among children with disabilities, on the relationship between child abuse and children's disabilities, and on the incidence of children who have developed disabilities as a result of child abuse or neglect. The report to the Congress was also to cover an assessment of the incidence of child abuse among children in alcohol abusing families and the relationship between child abuse and familial alcohol abuse. The study was expanded to include the relationship between child abuse and familial illicit drug abuse.

Funding for the project was provided by the National Center on Child Abuse and Neglect (Contract # 105-89-1630). The study, *The Maltreatment of Children With Disabilities and Child Maltreatment in Substance Abusing Families, 1991*, has been given to the National Data Archive on Child Abuse and Neglect for public distribution by Scott B. Crosse and Alexander C. Ratnofsky (Westat, Inc.) and Elyse Kaye (James Bell Associates, Inc.).

ABSTRACT

This study examines the incidence of substantiated maltreatment among children with cognitive, physical, emotional or learning disabilities, with specific attention given to the relationship between maltreatment and disabilities. It also investigates the incidence of child abuse and neglect among children in substance abusing families, and the relationship between child abuse and familial substance abuse. The data were collected from a nationally representative group of 35 Child Protective Services (CPS) agencies, which were asked to provide information on all cases of substantiated maltreatment over a four to six week period in early 1991.

The Archive distributes 5 data files for this study which provide information on a total of 1,249 substantiated maltreatment incidents. A case-level data file includes demographic information on the children and adults involved in each case, information on the timing, type, and reporting of maltreatment, data on the relationships between the individuals involved in each case, and case status. A second file contains caseworker assessments of children with suspected or known disabilities, as well as information on the sources and reliability of those assessments. An estimated 14.1 percent of the children in the study were identified by caseworkers as having one or more disabilities, using the definition found in the Americans with Disabilities Act (P.L. 101-336). A third data file contains substance abuse information for each adult in the study suspected of substance abuse. In addition to the three files mentioned above there are two files the which the Archive distributes which are restructured versions of the case-level file, in which the unit of analysis has been changed to represent an individual involved in a case.

ACKNOWLEDGMENT OF ASSISTANCE

All manuscripts which use data made available through the National Data Archive on Child Abuse and Neglect should acknowledge that fact as well as identify the original collector of the data. Users of these data are urged to follow some adaptation of the following statement with the parentheses indicating items to be filled in appropriately or deleted by the individual user.

The data (and tabulations) utilized in this (publication) were made available (in part) by the National Data Archive on Child Abuse and Neglect, Cornell University, Ithaca New York. Data from the study, *The Maltreatment of Children With Disabilities and Child Maltreatment in Substance Abusing Families, 1991*, were originally collected by Scott B. Crosse and Alexander C. Ratnofsky (Westat, Inc.) and Elyse Kaye (James Bell Associates, Inc.). Funding support for preparing the data for public distribution was provided by the National Center on Child Abuse and Neglect. Neither the collector of the original data, funding agency, nor the National Data Archive on Child Abuse and Neglect bears any responsibility for the analyses or interpretations presented here.

INFORMATION ABOUT THE USE OF ARCHIVAL RESOURCES

In order to provide funding agencies with essential information about the use of NDACAN resources and to facilitate the exchange of information about research activities among data users and contributors, each user of these data is expected to send two copies of any completed manuscript, thesis abstract, or reprint to the National Data Archive on Child Abuse and Neglect, Cornell University, Family Life Development Center, G20 MVR Hall, Ithaca, New York 14853-4401.

I. GENERAL STUDY OVERVIEW

Purpose of Study

The study was designed to shed light upon the relationship between maltreatment and disabilities among children. More specifically, the study makes possible an evaluation of whether children with disabilities are at greater risk of experiencing maltreatment than children without disabilities. As the study includes cases involving a variety of different types of childhood disabilities and maltreatment, hypotheses may be tested on a broad range of more specific questions. In addition, the study facilitates examination of the role of familial substance abuse in child maltreatment, and maltreatment of children with disabilities in particular.

The sample for this study was designed to facilitate direct estimates of the proportion of substantiated cases of maltreatment to children with disabilities and those in alcohol or drug abusing families. In addition to the information collected from the selected CPS agencies, the analyses described in the study's published reports include national data from two secondary sources: The Study of the National Incidence and Prevalence of Child Abuse and Neglect (NIS-2), and the U.S. Department of Education. These additional data were necessary for the computation of estimates of the disability rate among all maltreated children.

Sampling/Selection Information

The cases comprising this study are a nationally representative sample of child maltreatment cases substantiated by CPS (Child Protective Services) agencies. The sample was drawn from 36 CPS agencies selected using a county sampling procedure. The use of county sampling as a means of obtaining agencies was effective because, for the most part, agencies operate along county lines, and useful county-level information is readily available for stratification and deriving measures of size.

The sampling frame consisted of 3,185 counties, or pseudocounties in some states, from throughout the United States. Information on school enrollment, metropolitan status, and median household income for these counties was drawn from the County and City Data Book, 1988 prepared by the U.S. Bureau of the Census. In an effort to equalize the size of the entities being considered, an effort was made to substitute subagencies (regional or field offices) for large counties in the sampling frame. Data were collected on the relative size of the caseloads at each of the agencies or subagencies in the sampling frame.

The sample was to consist of 36 agencies, or “primary sampling units” (PSUs). To this end, the PSUs were stratified into two size categories, with county school enrollment of 53,122 students used as the cut-off point (school enrollment was used as a measure of size). The sample was allocated to small and large strata, consisting of 28 and 8 units, respectively. This design was expected to yield a total of 2,000 substantiated cases in a one-month period while the sampling rates differed as little as possible between the two strata. The PSUs were further stratified by the level of urbanicity (MSA, non-MSA), and by the county median household income. An equal probability systematic sample was selected from each stratum independently.

Once the agencies were selected, all substantiated cases from each participating agency for a four or six week period were selected. Two main advantages of this approach were: (1) that it was simple for the participating agencies to administer, and (2) it was possible to obtain the 2,000 cases within a four or six week period from 36 agencies, with minimal variation across the full sample in the probability of selection of individual cases. The main disadvantage was the potential for sampling biases associated with seasonal variation in the reporting of maltreatment to CPS agencies. Since school personnel were a major source of reports, the study was designed to include cases reported during months in which school was in session. In addition, information was collected from agency personnel on the numbers of cases reported each month over a year and on reasons for any variation in these numbers, in order to minimize the effect of seasonal variation. After taking these issues into account, it was decided that data collection would occur during the early spring of 1991.

Data Collection

The participating agencies were asked to begin data collection between February 4, 1991 and March 11, 1991. Caseworkers used printed sample instruments with instructions as to how to identify appropriate cases, and information on how to complete the study forms. In general, within an agency all newly substantiated cases for a six week period were included in the sample. For a few agencies the data were collected only for a four week period. (In the final data files this is accounted for in the weighting scheme by a data collection time period differential adjustment factor).

Methods

Weights were constructed at the agency level, taking account of the probability of selection for each agency in the sample. A baseweight was constructed for

each agency as a reciprocal of that agency's probability of selection. Adjustments to the baseweights were required for several agencies who failed to provide all the requested data for the study, or who were only able to collect data for a four-week period instead of the suggested 6-week period. The weights were further adjusted to reflect the average monthly substantiated caseloads processed by the agencies.

The estimation of survey errors was accomplished by the construction of replicate weights for each case and the computation of survey errors by the jackknife method using these weights.

See the **Final Reports to Congress** for more information on weighting methodology.

Analyzing the Data

Due to the complex sampling design employed in this study, analysis of the survey data requires the use of specialized software capable of adjusting for the different sampling probabilities across strata and the possibility that groups of observations taken from the same stratum may not be independent of each other. There are several statistical analysis packages specifically designed to handle studies with complex survey designs, all of which employ computational methods that produce unbiased and design-consistent variances (or standard errors) for the estimates and other statistics being computed. One such method involves the use of special weights, called replicate weights, which are included in the data file for this purpose. See the **Final Reports to Congress** for more information about replicate weight computation and use. **Appendix C: Specialized Software for Analysis of Complex Sample Surveys** contains information on how to obtain and use appropriate software for analyzing these data.

For more information on the study purposes, design, data collection, and results, see the Final Reports to Congress.

II. DESCRIPTION OF MACHINE-READABLE FILES

The Archive is able to distribute these data in a variety of ready to use file formats. Please refer to the NDACAN order form or call us for more information.

The Archive normally distributes 5 separate data files for this study. A brief description of these data files is provided below. For information regarding variables (including any derived variables), please see the individual codebooks corresponding to the data files in **Appendix A: Codebook Information**. Frequencies and summary statistics are also distributed on diskette or via FTP (File Transfer Protocol) and can be printed in 10 point Courier font from any standard word processor.

List of Files and Characteristics

(1) AHNRC3: 1,249 observations and 311 variables providing case-level information for all cases in the study as well as data on the children and adults involved in each case (one observation per substantiated maltreatment case).

Individual cases can be identified by a unique case id number (ID). Each case in the file allows for up to 12 children and 12 adults to be involved. Variables in this file include each child's birth date, sex, race/ethnicity, relationship to adults and other children involved in the case, description of the type of maltreatment (up to three types), and whether there was a suspected or known handicap prior to the maltreatment. The date of the maltreatment report is also included, along with an agency id code, case status and who first reported the case. For each adult involved in the case, the file includes variables indicating caretaker status, description of the adult's role in the maltreatment, the adult's age, sex, race/ethnicity and whether there was suspected or known alcohol or drug abuse. A full sample weight is included to enable the user to calculate weighted estimates, and 36 replicate weights are available for use in computation of variances adjusted for the complex survey design (see [Analyzing the Data](#), above).

(2) AH05: 300 observations and 58 variables providing information about children suspected or known to have disabilities (one observation per child).

Variables in this file provide information on the source and reliability of information on the presence of disabilities, as well as detailed information on the type of disability suspected.

(3) AH09: 635 cases and 38 variables providing information about adults suspected of substance abuse (one observation per adult).

Variables in this file provide information on the type of substance abuse suspected, and the source and reliability of that information.

(4) CHILD068: This is an Archive created file. It is a restructured version of the case-level file, in which the unit of analysis has been changed to represent an individual involved in a case. It contains 2,662 observations (a child may have been involved in more than one substantiated report) and 168 variables.

This file provides case information, adult information and personal demographic information for each child in the case-level file. An individual record in this file is uniquely identified by the combination of ID and CHCODE05.

(5) ADULT068: This is an Archive created file. It is a restructured version of the case-level file, in which the unit of analysis has been changed to represent an individual involved in a case. The file contains 2,305 observations and 223 variables.

This file provides all the case information, child information and personal information for each adult in the case-level file. In this file, an individual record is uniquely identified by the combination of ID and ADCODE09.

Linking the Data Files for Analysis

Some users may want to combine variables from several of these datasets, and others will want to analyze the data files separately. For those wishing to link the files, it is important to note that they are based on different units of observation. The first file listed above, AHNRC3, is a case-level file while the other two files are based on individuals. It is possible to combine either of the two individual-level files with the case-level file using the 7-character ID variable present in all files. A two-digit identification code (CHCODE05 in the children with disabilities file; ADCODE09 in the adult substance abuse file) can be used to match the disability/substance abuse data with the appropriate child/adult information at the case level.

This process may be problematic in that more than one child involved in a given maltreatment case may have a disability, and more than one adult may be suspected of alcohol or drug abuse. Therefore, there will not always be a one-to-one match between observations in the individual-level files and corresponding observations in the case-level file. For this reason, the Archive has created two additional files CHILD068 and ADULT068. Both are restructured versions of the

case-level file, in which the unit of analysis has been changed to represent an individual involved in a case.

Using these two derived files, it is relatively simple to combine individual information at the case-level with data on disabilities and substance abuse from AH05 and AH09. The case ID and the two-digit individual id variables (CHCODE05 and ADCODE09) must be used together to match observations. The SAS programs the Archive used to create the two derived files, as well as a sample program for merging the files, are included in Appendix B.

Notes About the Data

Secondary researchers should be aware of several factors that may affect the interpretation of study results. First, the study relied on caseworkers at CPS agencies, rather than qualified health care professionals, to assess “suspected” disabilities. The extent to which this may have biased study results is unknown. Second, children in institutional settings were not included in the caseloads of many of the CPS agencies from which data were collected. Therefore, the data represent primarily children in family settings. Finally, the timing of the study did not account for seasonal variation, if any, in occurrence and reporting of maltreatment and disabilities, as data were collected only during the late winter and early spring of 1991.

Users may notice that the ages of “adults” involved in the cases (variables B21_1 through B21_12 in dataset AHNRC3) are sometimes well under 18. When a child maltreated another child in the family, he or she was listed as an adult on the questionnaire form. The same was true of any persons under 18 who were parents of children for whom maltreatment was substantiated. Hence, the cases with adult age values less than 18 should be considered legitimate.

The variable CHCOUNT, which is meant to measure the number of names listed on the Child Information Form, may or may not match the number of children for whom data is included on the case record. Similarly, there may be a discrepancy between ADCOUNT (the number of adults listed on the Family Information Form) and the number of adults for whom data is actually present on the case record.

Data Processing History

A data file was originally prepared with nine record types for each substantiated maltreatment case included in the sample. From this file, three final data files

were created. The first consists of record types 1-4 and 6-8, which includes case information and information about the adults and children for each case. The second data file contains data from record type 5 describing children's disabilities. The third file contains data from record type 9 describing suspected alcohol or drug abuse by adults involved in the cases.

The Archive received the data from the principal investigators as three separate SAS datasets, one containing case-level data, another consisting of information on children's suspected or known disabilities, and a third containing information on suspected substance abuse by adults involved in the cases. All identifying variables were removed from the files to maintain confidentiality. We deleted 11 observations from the child disabilities file and 9 observations from the adult substance abuse file due to the fact that they had no matching case information in the case-level file. We investigated out-of-range values and corrected as many as we could with the help of the principal investigators. Eleven out-of-range values were changed to missing values.

Please contact the Archive directly if you have questions or encounter problems in using these datasets. Do not contact the principal investigators. The Archive has made an agreement with the investigators to field all questions related to this study.

Appendix C: Specialized Software for Analyzing Complex Sample Surveys

Survey samples are generally employed by primary researchers as a means of taking measurements on a representative portion of the population when it is logistically or financially impractical to sample observations directly. Observations are sampled from predetermined strata such that each observation in the final dataset can be thought of as representing a certain number of cases in the general population. *Complex surveys* differ from simple surveys in that observations sampled from one stratum in a complex survey sample may represent a different number of population members than observations taken from another stratum. In other words, the probability of a particular case being selected differs across strata.

In addition, a complex survey is characterized by multiple stages of sampling. In the present study, for instance, observations were sampled from six different strata, defined by school enrollment, metropolitan status, and county median household income. At each stage except the lowest, a cluster of observations was sampled and then further stratified. The use of multi-stage cluster sampling means that observations in the sample cannot be assumed to be independent of each other. One consequence of this complex sample design is that, while the *estimates* of survey statistics will be accurate, the *variances* of survey statistics, including means and proportions, estimated using standard statistical packages such as SPSS and SAS, are inappropriate and can be assumed to be biased.

There are several specialized software packages that utilize statistical methods designed to rectify this problem and produce approximately unbiased variances. These packages fall generally into two classes, those using linearization methods, and those using replication methods. PC CARP¹ and SUDAAN² are two popular packages that use linearization methods. Linearization methods employ a mathematical procedure known as Taylor Series estimation for approximating the value of a function that would be difficult to calculate precisely by other means.

By contrast, Westat Inc. has developed software that produces survey estimates and variances using replication methods. In short, replication involves

repeatedly selecting subsets of cases from the sample, calculating the estimate of interest, and then using the variability of these calculated quantities to estimate the variance of the full sample. For a more complete discussion of linearization and replication methods, see: Lee ES, Forthofer RN, Lorimor RJ (1989) *Analyzing Complex Survey Data*. Newbury Park, CA: Sage University Paper #71.

While any of the software packages mentioned above can handle complex survey designs such as that used in the current study, Westat's WesVarPC software has the advantage of being free of charge and easily obtainable electronically via the World Wide Web. This PC-based program is well-documented and available as a stand-alone Windows product. WesVarPC will read data in the form of a PC-SAS for DOS dataset (the default), a SAS transport file, a SPSS for Windows dataset, a dBase file, or an ASCII data file. It can compute variance estimates for complex functions of estimates, including ratios, differences of ratios, and log-odds ratios. It calculates sampling errors, variances and confidence intervals for the survey estimates you specify, as well as chi-square tests of independence for two-way tables of weighted frequencies. The package offers a choice of four replication methods: balanced repeated replication (BRR), two jackknife methods (JK1 and JK2), and Fay's method. The appropriate method to specify for this study is JK2.

Due to WesVarPC's easy availability and our familiarity with its use, the Archive supports this software for analyzing complex survey samples. For users with access to the Internet, WesVarPC can be obtained by using the URL: <http://www.westat.com>. There you will have an opportunity to download the latest version of the software and the complete documentation (in Adobe Acrobat format). Users who do not have access to the Internet will be sent diskettes containing the software and documentation. Send your request to the following address: WesVarPC c/o Maida Montes, Westat Inc., 1650 Research Blvd., Rockville, MD 20850, phone: 301-251-1500.
