## PREFACE

The data for *Physical Abuse Treatment Outcome Project: Application of Parent-Child Interaction Therapy (PCIT) to Physically Abusive Parents*, have been given to the National Data Archive on Child Abuse and Neglect for public distribution by Mark Chaffin. Funding for the project was provided by U.S. Department of Health and Human Services, The Administration on Children, Youth and Families, Children's Bureau, Office on Child Abuse and Neglect (Award Number: 90CA1633).

## ACKNOWLEDGEMENT OF SOURCE

Authors should acknowledge the National Data Archive on Child Abuse and Neglect and the original collector of the data when they publish manuscripts that use data provided by the Archive. Users of these data are urged to follow some adaptation of the statement below.

The data used in this publication were made available by the National Data Archive on Child Abuse and Neglect, Cornell University, Ithaca, NY, and have been used with permission. Data from *Physical Abuse Treatment Outcome Project: Application of Parent-Child Interaction Therapy (PCIT) to Physically Abusive Parents* were originally collected by Mark Chaffin. Funding for the project was provided by the U.S. Department of Health and Human Services, The Administration on Children, Youth and Families, Children's Bureau, Office on Child Abuse and Neglect (Award Number: 90CA1633). The collector of the original data, the funder, NDACAN, Cornell University and their agents or employees bear no responsibility for the analyses or interpretations presented here.

The bibliographic citation for this data collection is:

Chaffin, Mark (2004). *Physical Abuse Treatment Outcome Project: Application of Parent-Child Interaction Therapy (PCIT) to Physically Abusive Parents* (Dataset). Available from National Data Archive on Child Abuse and Neglect Web site, <http://www.ndacan.cornell.edu>

## PUBLICATION SUBMISSION REQUIREMENT

In accordance with the *Terms of Use Agreement* for this dataset, users of these data are required to deposit a copy of any published work or report based wholly or in part on these data with the Archive. A copy of any completed manuscript, thesis abstract, or reprint should be sent to the National Data Archive on Child Abuse and Neglect, Cornell University, Family Life Development Center, Beebe Hall, Ithaca, New York 14853. Such copies will be used to provide funding agencies with essential information about the use of NDACAN resources and to facilitate the exchange of information about research activities among data users and contributors.

---

## **ABSTRACT**

This project was a randomized clinical trial designed to test the efficacy and sufficiency of Parent-Child Interaction Therapy (PCIT) in preventing re-reports of physical abuse among physically abusive parents entering the child welfare system. One hundred ten physically abusive parents and their abused children were randomly assigned to one of three intervention conditions: 1) A modified PCIT-based parenting program, 2) The same modified PCIT-based program plus individualized wrap-around services, and 3) a community parenting group program that is representative of current standard care in the field. Pre- and post-test measures of the family were taken. Areas of assessment included depression, severity of abuse and neglect, internalizing and externalizing problem behaviors, child abuse potential, parent drug and alcohol disorders, parent-child interaction, parent and child intelligence, child's perception of parent behaviors, and parent's willingness to change behavior. A demographics questionnaire was also administered and a review of child maltreatment reports was conducted.

## STUDY OVERVIEW

### Study Identification

*Physical Abuse Treatment Outcome Project: Application of Parent-Child Interaction Therapy (PCIT) to Physically Abusive Parents*

**Principal Investigator(s):**

Mark Chaffin, Ph.D.  
University of Oklahoma Health Sciences Center

**Funding Agency:**

U.S. Department of Health and Human Services, The Administration on Children, Youth and Families, Children's Bureau, Office on Child Abuse and Neglect

**Award Number:** 90CA1633

### Purpose of the Study

The present study was designed to answer three research questions. First, can an adapted form of PCIT reduce physically abusive behavior relative to a standard community-based abusive-parent group parenting program? Second, will the addition of individualized wrap-around services enhance the outcomes of PCIT? Third, if PCIT is more efficacious than a standard community-based abusive-parent group parenting program, are the benefits consistent with the PCIT model which would predict that increased benefits would be mediated by changes in parent-child interaction patterns? It was hypothesized that PCIT would prove more efficacious, that the addition of wrap-around enhancements would improve outcomes, and that relative reductions in future physical abuse due to PCIT would be mediated by changes in parent-child interaction patterns, rather than by non-specific treatment factors such as reduced parent distress.

### Study Design

This study consisted of a sample of families referred to the study by the county welfare office. All cases had a recent confirmed report for child physical abuse. A randomized design was used whereby families were randomized into one of three groups: 1) A modified PCIT-based parenting program, 2) The same modified PCIT-based program plus individualized wrap-around services, and 3) a community parenting group program that is representative of current standard in the field. Data collectors were unaware of treatment condition assignments. Pre and Posttest measures were taken. Please read the final report for more study design information.

### Date(s) of Data Collection

1997-2001

### Geographic Area

Central Oklahoma.

### Unit of Observation

The unit of observation for the DS100 file is the family. The unit of observation for the DPICS Pretest and Posttest files is the rater's behavior coding for each of the three video-taped situations.

### Sample

A total of 300 cases were referred to the project by the county child welfare office. All cases had a recent confirmed report for child physical abuse. Referrals were eligible for the study if: 1) both the abusive parent and abused child were available to participate together in treatment, and no legal termination of parental rights or abdication of parenting role had been initiated, 2) the abusive parent had a minimum measured K-BIT score of 70, 3) the child was between four and twelve years old, 4) the identified parent did not have a child welfare report as a sexual abuse perpetrator, and 5) the parent and child appeared able to participate in the intervention. Basic demographic information was collected from the referring child welfare worker on all referrals. Of those referred, 112 were enrolled as participants and randomized into one of three treatment groups. Two families were removed from the data analysis based upon the opinion of the data collector that the participant did not comprehend the assessment questions and could not provide valid data (N= 110). Non-abusive parents or parent's partners, and non-abused or non-index siblings were included as collateral participants in the interventions, but did not provide data.

### Data Collection Procedures

A baseline assessment was conducted that included review of the index child welfare investigation and all prior child welfare reports, administration of self-report measures or structured interviews, and observational coding of a structured parent-child interaction. Following baseline assessment, parent-child dyads were randomly assigned to one of three parenting intervention conditions. All three intervention conditions were structured and required approximately 6 months to complete. Ongoing service utilization was tracked, and after program completion (or at 6 months if participants dropped

out of treatment prematurely) the assessment package was repeated. Data collectors were uninformed about treatment condition assignment. Follow-up for detected child maltreatment outcomes was obtained from the statewide child welfare administrative database. Please read the "Procedure" section in the final report for a more detailed data collection procedures description.

### Response Rates

Thirty-seven percent of the cases referred by the child welfare office were enrolled into the study.

### Sources of Information

Data were collected through a review of the index child welfare investigation and all prior child welfare reports, administration of self-report measures or structured interviews, and observational coding of a structured parent-child interaction. Data about child maltreatment outcomes were obtained from the statewide child welfare administrative database.

### Type of Data Collected

Self-report surveys, structured interviews, administrative records, and observational coding of a structured parent-child interaction.

### Measures

#### ABUSE DIMENSIONS INVENTORY (ADI):

The ADI (Chaffin, Wherry, Newlin, Crutchfield, & Dykman, 1997) is an ordinal measure of the severity of sexual and/or physical abuse across several dimensions (e.g., type and extent of abuse, duration, relationship between the abuser and victim, use of force or coercion, and reaction of the abuser). Severity rankings were developed based on a national survey of professionals working in the field of child abuse and the instrument has been shown to have high inter-rater reliability. The research assistants completed the ADI based upon a review of written CPS investigative information and/or an interview with the CPS worker. Inter-rater reliability for the ADI was monitored by randomly selecting 10% of the sample for re-coding by an independent rater. The mean inter-rater reliability for ADI scores for the current study was 0.76.

SPECIAL NOTE(S): Contributor provided the scores for this measure, but did not archive the individual items. Two ADI files are included. The referral event file represents information provided by the referring CPS worker. The "all CPS Records" file represents codings based on a review of the present as well as all prior CPS investigation records.

#### BECK DEPRESSION INVENTORY (BDI):

The BDI (Beck, Ward, Mendelson, Mock, & Erhaugh, 1961) is a well known and widely used 21-item self-report measure of depressive symptoms. Higher scores indicate more severe symptoms of depression, but not a diagnosis of depressive disorders. This measure has been found to be a highly reliable and valid indicator of depressive symptoms and sensitive to changes in those symptoms over time and treatment. The identified abusive parent completed the BDI.

SPECIAL NOTE(S): Contributor provided the scores for this measure, but did not archive the individual items.

**BEHAVIOR ASSESSMENT SYSTEM FOR CHILDREN (BASC):**

The BASC (Reynolds and Kamphaus, 1992) is a set of instruments for rating behavior, thoughts, and emotions of children ages 4 to 18 relative to standardized age and gender referenced norms. It provides measures of adaptive as well as problematic behaviors, includes specific age-appropriate items, and compares information from multiple sources (self, parent, and teacher report) of a variety of internalizing and externalizing behaviors: aggression, anxiety, depression, disruptive behavior, etc. Internal consistency and temporal stability of the scales ranges from the mid .70's to the low .90's. The identified abusive parent completed the parent-report version of the BASC. The identified abused child completed the child-report version of the BASC. If possible, a teacher-report version of the BASC was obtained from the child's most recent classroom teacher.

**SPECIAL NOTE(S):** Contributor provided the scores for this measure, but did not archive the individual items. All scores are t-score outputs from the BASC scoring program.

**CHILD ABUSE POTENTIAL INVENTORY (CAP):**

The Child Abuse Potential Inventory (Milner, 1986) is a widely used 160 item agree/disagree format questionnaire developed to estimate risk for committing child physical abuse. The CAP Abuse Scale, which is the main interpretative scale of the CAP, has been reported to have high internal consistency (KR-20 = .92 - .95), a one-month test-retest stability of 0.83, and good discriminant and future predictive validity (Milner, 1986). Normative values for the Abuse Scale are slightly less than 100 (Milner, 1986). Both English and Spanish language versions were made available to participants. The identified abusive parent completed the instrument. The instrument has logically-derived validity scales to detect positive response bias, although it is not clear that invalid profiles actually void the validity of the test.

**CHILD MALTREATMENT REPORTS:**

As authorized by participants' written consent, the study was able to obtain past and future records of maltreatment reports made to the state CPS system. Computer database matches were executed using the unique identifier assigned to the identified abuser and the family within the CPS database. Referrals that were classified as screened-out or ruled-out without subsequent assessment or investigation were excluded, and reports were aggregated across incidents, dates, and children in order to remove duplications. Separate aggregations were executed for each major maltreatment category (i.e., physical abuse reports, neglect reports, sexual abuse reports). Both past reports (i.e., prior to study enrollment) and future reports (i.e., after study enrollment) were gathered. Each report was examined manually to insure that the match was exact for the family and reported abuser. Any reports made by the study service providers (i.e., surveillance effect) were removed (N = 5). All surveillance effect reports occurred in cases that also had other re-reports from different sources. Thus, removing surveillance effect reports altered the time to re-report, but did not effect cumulative re-report rates.

**CHILD NEGLECT INDEX (CNI).**

The CNI (Trocme, 1996) is an easy to use instrument yielding an overall severity score for child neglect. Adequate temporal stability and correlation with lengthier instruments have been reported. A research assistant completed the CNI based upon a review of written CPS investigative information and/or an interview with the CPS worker.

**SPECIAL NOTE(S):** Contributor provided the scores for this measure, but did not archive the individual items.

**DEMOGRAPHIC QUESTIONNAIRE:**

Captured basic demographic information, health related behaviors (e.g., use of tobacco, drugs, alcohol), lifestyle characteristics (e.g., car and phone ownership, geographic stability, time spent watching television, telephone use, etc.), and social relationships (e.g., participation in social activities, involvement with family). The questionnaire was available in English and Spanish. An early version of the questionnaire was pilot tested on 100 parents in similar programs, and items answered inconsistently or indicated by parents to be confusing were corrected. For ordinal or ratio level data items, the mean two-week test-retest correlation was 0.74, and was 0.79 for nominal-level items, excluding items with no expected variability (e.g. gender, date of birth) and items which might not be expected to be stable (e.g., recency of last drink of alcohol). The identified abusive parent completed the instrument.

**SPECIAL NOTE(S):** Contributor did not archive all individual items.

**DIAGNOSTIC INVENTORY SCHEDULE (DIS) ALCOHOL AND DRUG MODULES, AND ANTISOCIAL PERSONALITY DISORDER MODULE:**

The DIS (Robbins, Helzer, Croughan & Ratcliff, 1981) is a structured diagnostic interview based upon DSM diagnostic criteria and designed for epidemiological research. DIS self-reported alcohol and drug disorders have been found to prospectively predict risk for maltreatment (Chaffin et al., 1996). We modified the modules for use as a self-report instrument, a modification which past studies have suggested yields valid results (Kovess & Fournier, 1990). The DIS alcohol disorders module has been used as a criterion measure against which other alcohol measures are tested, and is substantially correlated with other alcohol measures and with clinician diagnoses. (Goethe & Ahmadi, 1991; Goethe & Fischer, 1995; Watson, Detra, Fow, & Ewing, 1995). The DIS drug disorders have high agreement with other diagnostic measures of drug disorders (Hasin & Grant, 1987).

**SPECIAL NOTE(S):** DIS scoring uses the original DIS diagnostic algorithms. These may not correspond exactly with DSM-IV criteria.

**DYADIC PARENT-CHILD INTERACTION CODING SYSTEM (DPICS-II):**

The DPICS-II is a structured observation of parent-child interactions during a three-part task: child-directed activity, parent-directed activity, and clean-up from the activity (Eyberg, Bessmer, Newcomb, & Edwards, 1994). It contains codes for parent behavior (commands, praises, etc.), child behavior (compliance, disruptive responses), and parents' responses to child's behavior. Inter-rater and test-retest reliability as well as discriminant validity between referred and non-referred children are satisfactory. Interactions were videotape recorded, then coded by a research assistant who was blind to study condition. Coders were trained to criteria using a standard videotape stimulus set before coding any study data, and their coding checked periodically by the trainer to prevent drift.

**THE KAUFMAN BRIEF INTELLIGENCE TEST (KBIT):**

The KBIT (Kaufman & Kaufman, 1990) is a brief (about 15 to 30 minute) individually administered screening measure of verbal and nonverbal intelligence for people ages 4 to 90. It provides a measure of crystallized thinking and fluid thinking, with two sub-scales: Vocabulary and Matrices which correlate highly with more comprehensive tests of cognitive functioning. The KBIT was administered as an eligibility screen for the identified abusive parent and child.

**SPECIAL NOTE(S):** Contributor provided the scores for this measure, but did not archive the individual items.

**PARENT PERCEPTION INVENTORY (PPI):**

The PPI (Hazzard et al., 1983) is designed to assess a child's perception of positive and negative parent behaviors. It contains 18 items, 9 items ask about positive behaviors and 9 items ask about negative behaviors. The instrument uses a five-point scale ranging from "never" (0) to "a lot (5)." Child participants completed the inventory for each parent. The identified abusive parent completed a similarly structured inventory about their child/household.

**THE STAGES OF CHANGE READINESS AND TREATMENT EAGERNESS SCALE (SOCRATES):**

The SOCRATES (Miller and Tonigan, 1996) is brief structured measure based on Prochaska & DiClementi's (1983) transtheoretical approach to measuring a client's willingness to change behavior. The measure has been used in research on smoking cessation and maintenance of other health behaviors and has been shown to be predictive of treatment compliance. Internal consistency and temporal stability indices range from the .80's to the low .90's. For this study, the measure was adapted as a questionnaire reflecting motivation to change parenting behavior in general and changing the use of hitting as a parenting behavior in particular.

SPECIAL NOTE(S): No factor scores are included, instrument lacks an established scoring metric.

Prepared for U.S. Department of Health and Human Services by Chaffin et al. under grant no. 90CA1633. Oklahoma City, OK: University of Oklahoma Health Sciences Center.

Analytic Considerations

All variables in the archived data set are untransformed. Note that distributional assumptions may not be met and transformations may be required depending upon the analysis performed. Many analyses reported in the final study report used transformed values, typically square root transformations or binomial transformation.

No multiple imputation data sets are included, although several were used to compile the final study report. Imputed values in these data sets will depend upon the imputation model selected, which will vary with the analysis performed, and will usually require that variables in the analytic model are also present in the imputation model.

Confidentiality Protection

Potentially identifying information was removed by the contributor, including dates, dates of birth, tribal affiliations, occupation, zip codes, information about living arrangements, etc. Ages are rounded to the nearest year.

### Extent of Collection

This data collection consists of 28 SPSS system data files, a User's Guide and Codebook, the project's final report and appendices, a copy of the measures used in the study, and a syntax file for deriving scale scores.

### Extent of Processing

NDACAN produced the User's Guide and Codebook, and created a single data file that combines the most relevant study variables.

### Data File Notes

The "DS100" file consists of variables from 27 individual data files. The file was created by including the score variables from each of the individual files. In instances where score variables were not archived by the contributor, all variables from those files were included in the DS100 file. Please note that variables from the DPICS Pretest and DPICS Post test files were not included in the DS100 file because of a unit of observation mismatch. The unit of observation for the DPICS files is the rater's behavior coding for each of the three video-taped situations, whereas, all of the other files' unit of observation is the family.

Other study raw data collected by the contributor were not archived, such as data collected to establish inter-rater reliability, protocol adherence data or data collected for separate but related projects. Data on inter-rater reliability and protocol adherence is contained in the final report.

No factor scores are provided for instruments lacking an established scoring metric.

Two codebooks are provided, one for the DS100 file and one for the DPICS files.

**CODEBOOK: Dataset #100 Variable Information**

Each Codebook consists of three sections. The first two sections are lists of the variables in the file, which are first listed in the order in which they appear in the data file followed by an alphabetic listing. The third section contains a detailed description of the variables arranged in the order in which they appear in the file.

In the descriptive section the file's variable names, variable labels, and variable formats are provided on the first line. Variable values and their corresponding labels are listed as appropriate.
